Classesd Styles

Columns and Floats

column 가 가

```
<WRAP column 30%>...content...</WRAP>
```

가 _____

, ,
. .

```
/***_가                _**/
```

가

```
/***가                **/
```

,

```
**//No Headline/**
```

Normally you would only need the class **column**, but for more sophisticated uses (not only for columns, but for any other classes, like **boxes** and **notes** as well) you can have several kinds of “floats”:

- **column** is the same as **left** in LTR languages and the same as **right** in RTL languages
- **left** will let you float your wrap on the left
- **right** will let the wrap float right
- **center** will position the wrap in the horizontal center of the page

After using any of the float classes, you might come across something like this, where the following text protrudes into the space where only the floating containers should be ...

type	e.g.	note	
%	30%	makes sense in a liquid layout	
px	420px	makes sense if your layout has a fixed pixel width or if your container contains images with a certain width	
em	20em	makes sense if you like your wrap container to grow and shrink with the font size or if your layout is em-based	

A **table** inside a column or box will always be **100% wide**. This makes positioning and sizing tables possible.

... to prevent that, you should simply add

```
<WRAP clear></WRAP>
```

after your last column.

You **can** use the same options with spans (as each element that floats is automatically a block level

element), but it probably doesn't make too much sense. (by design), but can make sense, when it is floating.

Widths on spans normally do not work

Attention: Widths can cause problems and will often look different and break in some browsers. If you're not a web developer, you might not understand any problems regarding the [box model](#). Just try to test your columns in all major browsers and make your widths smaller than you initially think they should be.

All of those options will also work in the [boxes and notes](#) wraps (see below).

For modern browsers (Firefox, Chrome and Safari) you can use multi-columns. Just use **col2** for 2 columns, **col3** for 3 columns, **col4** for 4 columns and **col5** for 5 columns.

Note: Multi-columns don't make sense for spans.

You can use these different text alignments:

- **leftalign**
- **rightalign**
- **centeralign**
- **justify**

Center aligned text ...

... and right aligned.

```
<WRAP centeralign>  
Center aligned text ...  
</WRAP>
```

```
<WRAP rightalign>  
... and right aligned.  
</WRAP>
```

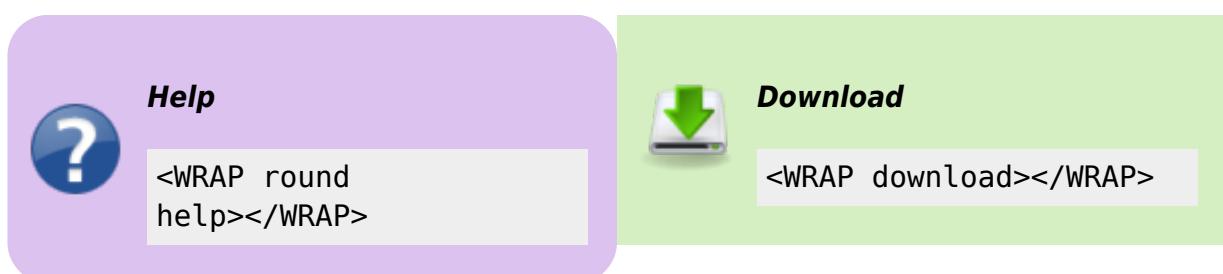

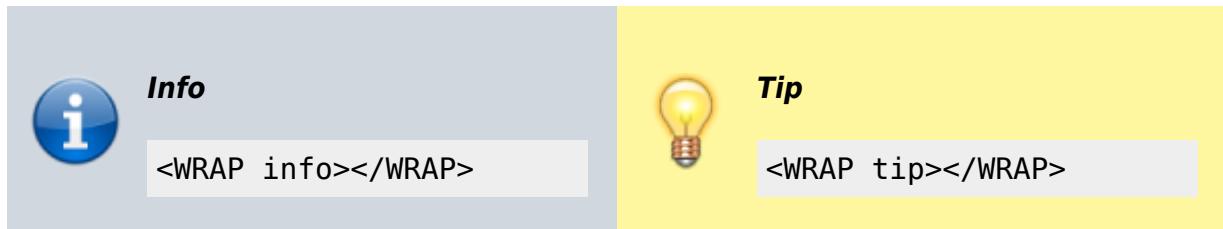

You cannot add alignments to spans.

round box 570px center

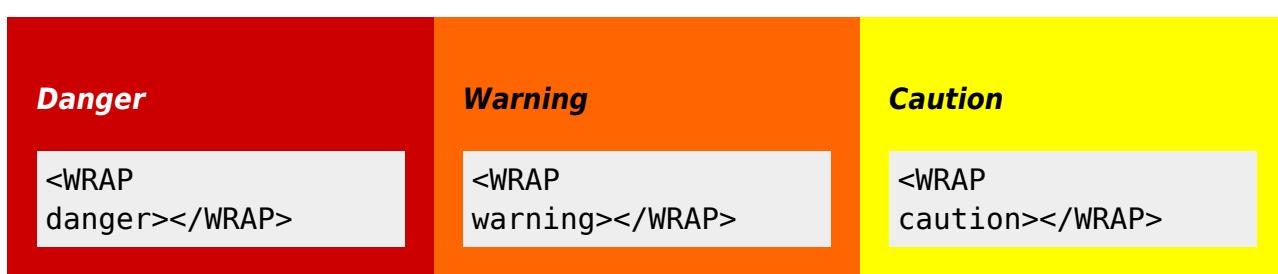

- **box** creates a box around the container and uses the colours from the

template's style.ini as default colours (__background_alt__ and __text__)

- any of the classes info, tip, important, alert, help, download, todo will add a special note container with a corresponding icon
- the classes danger, warning, caution, notice, safety use safety colours (and no icons)
- round can be added to anything with a background colour or a border and will only work in modern browsers (no Internet Explorer)

:

Notice

```
<WRAP round  
notice></WRAP>
```

Safety

```
<WRAP round  
safety></WRAP>
```

You can use notes and boxes also inside text with spans like this: info, help, alert, important, tip, download, todo and round box and danger, warning, caution, notice, safety.

```
<wrap info>info</wrap>, <wrap help>help</wrap>, ...
```

Marks

You can mark text as highlighted, less significant and especially emphasised.

You can mark text as <wrap hi>highlighted</wrap>, <wrap lo>less significant</wrap> and <wrap em>especially emphasised</wrap>.

This might look ugly in some templates and should be adjusted accordingly.

This text will appear indented.

```
<wrap indent>This text will appear indented.</wrap>
```

This text will appear "outdented".

```
<wrap outdent>This text will appear "outdented".</wrap>
```

Prewrap

Inside this code block the words will wrap to a new line although they are all in one line.

```
<WRAP prewrap 250px>
<code>
Inside this code block the words will wrap to a new line although they are
all in one line.
</code>
</WRAP>
```

Spoiler

```
: .....  
: <wrap spoiler> .....</wrap>  
( ) .
```

Hide

```
:  
: <wrap hide>John, please revise that sentence.</wrap>
```

The text will still appear in the source code, in non-modern browsers and is searchable.
Do not hide any security risky secrets with it!

Pagebreak

```
pagebreak 가 :
```

```
